The above dataframe shows similar restaurants to idx=99 ie Burger King (first row of the dataframe). We can aproximate this similarity from the columns 'attributes' and 'categories'. We see that the restaurants recommends fast-food places in categories such as pizzas, burgers and donuts and with similar attributes such as noiseLevel:average and RestaurantTakeOut as True

MODEL SELECTION

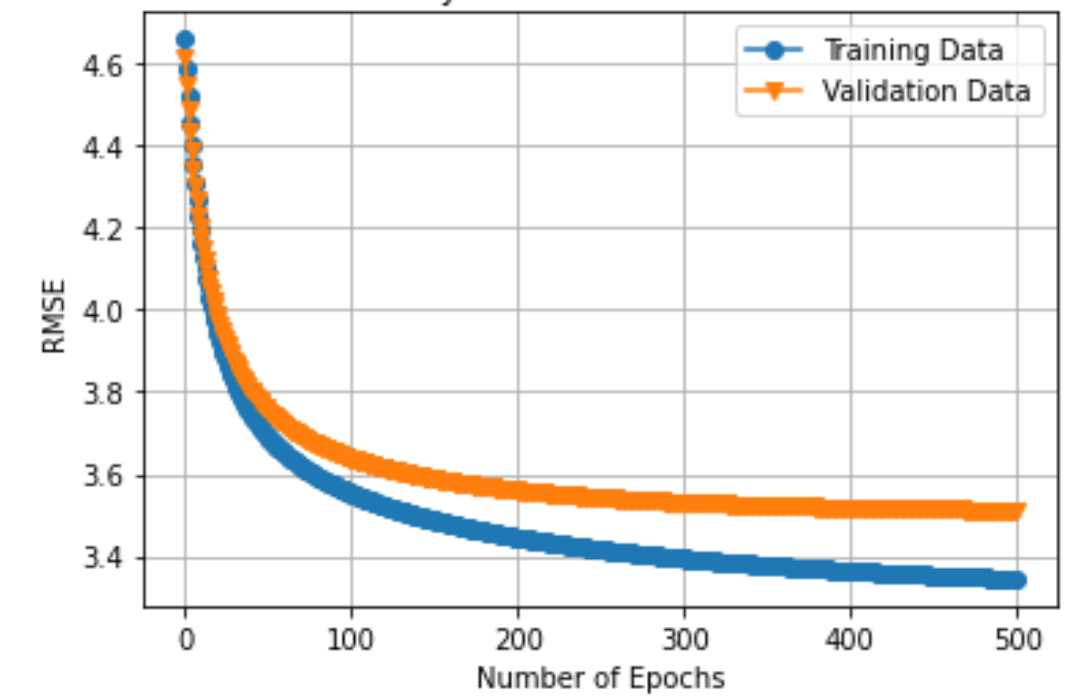

Recommendation System using randomly initialized latent vectors

Recommendation System using Restaurant Features

Recommendation System with PCA on restaurant features

Sr. no.	CF Recommender type	RMSE
1	CF Recommender using randomly initialized latent vectors	1.44
2	CF Recommender using restaurant features	2.81
3	CF Recommender with PCA on restaurant features	3.51

Future Works

We can make a Semantically Aware Explainable Recommender System using Asymmetric Matrix Factorization: The semantic data can be a source of knowledge for the system about both users and items, which can then be used to create meaningful explanations from the relations between both. If a semantic feature belongs to an item; in our case, a restaurant category such as serving vegetarian food or so like young, male are semantic features of the word boy which can be converted to binary. So, this way we can generate more features, or recommend specific restaurants to users.

Conclusion

According to our RMSE score, Recommendation System using randomly initialized latent vectors looks performing better with RMSE equal to 1.38 followed by Recommendation System using Restaurant features and Using PCA on restaurant features with RMSE 2.74 and 3.51 respectively.
